

Jiucaihezi Studio

Creative Agent Product Introduction

A product guide for customers, partners, content teams, and everyday users

One account. Every model. A second brain that never forgets.

13. What users receive
14. How it differs from common AI workflows
15. Product direction and vision
16. Access information
17. Important notes

1. What Jiucaihezi Studio Is

Jiucaihezi Studio is an AI creative workspace that brings international and domestic AI models, creative Agents, project memory, image/video/audio generation, and downstream production tools into one

connected environment.

It is not merely a chatbot, and it is not limited to generating one image or one piece of text. Its purpose is to help users move an idea forward until it becomes a usable creative deliverable.

Within one account and one project, users can:

- discuss ideas, organize requirements, and create plans;
- write novels, screenplays, episode outlines, and production-ready drafts;
- build character, location, prop, and world-setting materials;
- generate images, videos, audio, and visual assets;
- review, revise, align, and organize assets on a canvas;
- combine images, video, audio, subtitles, and other materials into a more complete work;
- preserve important project information for future search and reuse.

In simple terms, Jiucaihezi Studio helps users avoid moving between many models, accounts, applications, and disconnected chat histories while carrying out one creative project.

2. The Problems It Solves

2.1 Powerful models are scattered across separate products

Today, each model often comes with its own product, account, interface, subscription, history, files, and workflow. A character may be designed in one tool, written into a script in another, and turned into video in a third. Project context is easily lost between steps.

Jiucaihezi Studio provides a unified model entry point, so model selection happens inside the same creative project.

2.2 Using multiple AI services can be difficult for everyday users

Different AI products may require different registration methods, network conditions, payment methods, quotas, and operating habits. Users without a technical background can spend more time configuring tools than creating.

Jiucaihezi Studio aims to reduce this barrier through one account and one workspace. Available models, services, pricing, and access conditions depend on the current product page and the user's account.

2.3 Coding Agents are powerful, but are not designed primarily for creative production

Coding Agents are usually centered on code repositories and engineering files. They are excellent for software development, but creative work needs a workflow built around stories, characters, scenes, shots, images, video, and audio.

Jiucaihezi Studio brings Agent-style execution into creative production rather than treating every task as a programming task.

2.4 Direct chat is fast, but long projects easily lose context

A normal chat is useful for quick questions, but long projects can suffer from changing character details, forgotten world rules, scattered references, and assets that do not connect naturally to the next production step.

Jiucaihezi Studio is designed to balance speed, continued execution, and preservation of project facts.

3. Product Positioning and Working Logic

Jiucaihezi Studio is not a standalone chatbot, a standalone image generator, or a coding Agent with a different interface. It is an AI production system for creative work, composed of:

1. **Unified model access:** multiple models inside one account and project;
2. **Creative Mode:** a controlled execution layer that can use project files, Skills, and tools;
3. **Professional Skills:** structured workflows for novels, scripts, characters, scenes, props, storyboards, and media prompts;
4. **Project knowledge base and Second Brain:** reusable, searchable project facts and settings;
5. **Creation Panel:** a place to submit image, video, audio, and other media tasks;
6. **Canvas:** a workspace for reviewing, comparing, editing, and arranging generated results;
7. **Project files and production tools:** a bridge from text and generated assets to further production.

The basic logic is:

Users define goals, make judgments, and choose among options. AI understands, executes, generates, and organizes. The system provides the unified entry point, preserves the project, and connects each stage.

4. One Account for Multiple AI Models

Jiucaihezi Studio places different kinds of models in one creative workspace. Users can select a suitable model for each task without opening a new product, signing into another account, or rebuilding the workflow every time.

Language models

Current or planned language-model access may include Claude, GPT, Grok, Gemini, DeepSeek, GLM, and other international or domestic models.

Image, video, and audio generation

Depending on current integrations, the Creation Panel may support image, video, audio, and AI application tasks such as GPT Image 2, Banana Pro, Sora, Grok-related media capabilities, CDA, and other media engines.

Model names and availability may change with integrations, versions, and account permissions. The names above describe the scope of the product, not a guarantee that every model is available at every moment.

Practical value of unified access

- **More freedom of choice:** use different models for writing, reasoning, images, video, and audio;
- **Continuous projects:** model switching does not break the project;
- **Centralized assets:** generated results can return to the same project;
- **Easier collaboration:** teams do not need to build separate model stacks;
- **Less repeated setup:** users do not need to learn a completely different product for every model.

There may be many models, but the creative entry point can remain one.

5. Creative Mode: An Agent That Executes Creative Work

5.1 What Creative Mode is

Creative Mode is Jiucaihezi Studio's core working mode. Users can describe a goal in natural language, for example:

- I want to make a particular kind of novel or short drama;
- turn this script into character, scene, and prop materials;
- convert this scene into storyboard prompts for image or video generation;
- read the project settings and check this episode for contradictions;
- organize the generated assets and continue the production process.

Within the project scope, Creative Mode can read relevant materials, call Skills, use tools, write results into project files, or submit tasks to the Creation Panel.

5.2 How it differs from ordinary chat

Ordinary chat mainly answers one question at a time. Creative Mode focuses on moving a project forward. Instead of leaving everything in the conversation window, it can turn long-term results into project documents, knowledge-base entries, or media assets.

5.3 How it differs from coding Agents

A coding Agent centers on code and an engineering repository. Creative Mode centers on a creative project and its production workflow. It is as direct as chat, as executable as an Agent, and designed for creative work rather than only programming.

6. The Second Brain: Project Memory

Long projects need a stable source of truth: character identity and appearance, scene rules, prop details, completed story events, settings that must not change, unresolved plot threads, and the currently valid version.

Jiucaihezi Studio organizes project materials in a Wiki-like knowledge base, giving important information five useful properties: it can be searched, structured, updated, reused, and traced back to project facts where appropriate.

The five-layer memory cycle

1. **Everything to Wiki:** organize conversations, documents, scripts, and notes into a maintainable structure;
2. **Raw to Wiki:** preserve confirmed source facts and evidence;
3. **Query:** retrieve information by keyword, character, location, plot, or project topic;
4. **Consistency check:** detect naming drift, setting conflicts, continuity errors, missed replacements, broken links, and unresolved setups;
5. **Correction:** write confirmed corrections back into the source files and knowledge base.

Collect → preserve → query → inspect → correct.

The goal is not to make the model pretend to remember more. The goal is to give the project maintainable knowledge assets.

7. From Words to Images, Video, and Audio

Idea / IP → Story or novel → Script and episode drafts → Character / scene / prop assets
→ Storyboards and shot design → Image generation → Video and audio generation
→ Canvas refinement → Subtitles, editing, and final delivery

Step 1: Clarify the creative plan

Use Creative Mode and professional Skills to define visual direction, characters, locations, props, story beats, camera instructions, prompts, and reference materials before generating media.

Step 2: Submit a media task

In the Creation Panel, select an image, video, audio, or other task; choose a model; enter the prompt; attach reference images, start frames, end frames, or audio when needed; check ratio and duration; then submit.

Step 3: Refine and organize on the canvas

Generated results are usually drafts. Users can compare outputs, repair details, adjust composition, organize multiple assets, and reuse selected results as references for later generation.

Step 4: Assemble and export

Return to Creative Mode to combine images, video, and audio, add subtitles or titles, join clips, convert formats, and prepare a deliverable. The exact tool range depends on the current version and device environment.

Prompt → generate → refine → assemble.

8. What Users Can Create

Novels and long-form stories

Develop a project from genre and core premise to world-building, character relationships, outlines, chapter plans, prose, continuation, revision, and continuity checks.

Manhua, short dramas, and screenplays

Build stories, episode outlines, cliffhangers, reversals, hooks, action chains, production-ready drafts, characters, scenes, props, and storyboards.

Character, scene, and prop assets

Create character control sheets, empty-environment masters, prop multi-view references, key markings, posters, covers, and visual consistency requirements for reuse across shots and chapters.

Image, video, and audio content

Produce story illustrations, character concepts, scene and prop images, storyboard panels, short-video shots, voice-over, dialogue, dubbing, posters, covers, and e-commerce visuals.

E-commerce and scenario-based creation

Scenario-specific workspaces can simplify product-image requirements, reference images, and delivery targets through forms and guided steps. The same direction can expand to more creative and business scenarios.

Professional capability stays underneath; simple entry points stay on the surface.

9. Web and Desktop Access

Web

Visit <https://jiucaihezi.studio/> to enter quickly. The Web version is suitable for conversation, lookup, and lightweight creation.

Desktop App

The desktop App supports macOS and Windows and is better suited to long-term management of files, knowledge bases, media assets, and complete creative workflows. Download details are provided on the product page.

The Web and desktop versions belong to the same creative system. Available features may differ by version and platform.

10. Detailed Getting-Started Guide

Step 1: Open the website or App

Visit <https://jiucaihezi.studio/> in a browser, or open the installed Jiucaihezi Studio App.

Step 2: Register or sign in

Follow the on-screen instructions. After signing in, enter your workspace and projects. If available, use Settings to manage account details, model options, and App downloads.

Step 3: Create a project

Give each project a clear goal, such as *Short Drama Project*, *Brand Film*, *E-commerce Product Images*, or *Personal Content Series*. The project is the shared scope for files, conversations, knowledge, and media assets.

Step 4: Describe the goal before asking for output

Explain what you are making, who it is for, the desired final result, available source materials, style/size/duration/platform requirements, and what must remain fixed.

Example:

I want to make a 60-second brand introduction video for customers who are hearing about Jiucaihezi Studio for the first time. Please first organize the product positioning, audience, video structure, and shot requirements. Do not generate the video yet.

Step 5: Choose a mode and model

- **Chat Mode:** quick discussion and questions;
- **Coding Mode:** software development and code projects;
- **Creative Mode:** novels, scripts, characters, scenes, prompts, media, and long-term creative projects.

For content and visual production, choose Creative Mode. Select a model based on the task. You do not need to study every model before starting.

Step 6: Use Skills for specialized work

Ask directly for tasks such as creating a character prompt, breaking a script into shots, building scene and prop references, reverse-engineering an image prompt, checking continuity, or organizing a conversation into the project Wiki.

Step 7: Save confirmed results

When a character, scene, plot point, style, or production plan is confirmed, ask the Agent to save it to the project, create or update the relevant material, preserve the previous version if needed, and record the changes.

Step 8: Generate media

In the Creation Panel, select the task type and model, enter the prompt, add references, check ratio, duration, price, and account balance, then submit. Media generation may consume credits or incur charges.

Step 9: Review and refine

Check character and setting consistency, composition, ratio, unwanted elements, and delivery quality. Decide whether to repair, extend, regenerate, or replace the result. Use the canvas for continued editing and comparison.

Step 10: Assemble and export

Ask the system to arrange clips by shot order, add dialogue subtitles, create a vertical preview, or convert formats. Review and confirm the scope when files, commands, or media processing are involved.

Step 11: Maintain project memory

For long projects, periodically query project materials, preserve new facts, inspect names and timelines, correct source files, organize versions, and make backups.

11. A Simple First Project Example

Suppose you want to make a 30-second short-drama trailer:

1. **State the goal:** an urban revenge story for short-video viewers, with strong conflict, fast pacing, vertical video, and subtitles.
2. **Ask for a plan:** have Creative Mode provide the selling points, timing, shot list, dialogue, and visual prompts before generating media.
3. **Confirm and save:** once the relationships and structure are approved, save the character, shot, and style requirements to the project.
4. **Generate:** create first-frame images from the shot list, then turn selected first frames into video.
5. **Refine and deliver:** correct inconsistent shots, assemble the clips, add subtitles, and export a 9:16 preview.

The basic method is:

State the goal → plan → save the settings → generate assets → refine → assemble and deliver.

12. Who It Is For

Jiucaihezi Studio is suitable for novelists, web-fiction creators, manhua and short-drama writers, screenwriters, directors, producers, AI image and video creators, content teams, e-commerce and brand teams, small teams maintaining shared content assets, and everyday users who want multiple AI capabilities without learning many separate products.

It is especially useful when a project is long-running, requires repeated revision, needs character or visual consistency, uses text plus image/video/audio, or must turn an idea into a real deliverable.

13. What Users Receive

Users receive more than an answer from one model. They receive a connected way to work: unified model access, a project-based creative space, an executable Creative Mode, maintainable project memory, a pipeline from text to media, a canvas for refinement, and both Web and desktop entry points.

The practical result is less switching, less repetition, less lost context, fewer scattered assets, and more reusable project material.

14. How It Differs from Common AI Workflows

Dimension	Single-model product	Coding Agent	Direct chat	Jiucaihezi Studio
Model access	One product	Development-focused	Usually one model at a time	Multiple models through one account
Main focus	One conversation or generation	Code and repository	Quick answers and generation	Long-term creative projects
Project memory	Usually limited	Engineering structure	Depends on context	Wiki, facts, inspection, and correction
Creative workflow	User organizes it	Not the main goal	General and easy to derail	Creative Mode and Skills
Media and post-production	Often separate	Usually not central	Weak project connection	Continue inside the same project

Jiucaihezi Studio does not aim to replace every model. It connects models, projects, professional workflows, and downstream production.

15. Product Direction and Vision

Jiucaihezi Studio starts with creative work because novels, scripts, and film production clearly expose the major challenges of AI: long project cycles, consistency, repeated revision, multiple media types, and the need to connect generated results to real production.

The product will continue turning professional capability into easier scenario-based entry points for manhua, short dramas, novels, film and television, e-commerce, branding, self-media, and other long-running work.

AI should not belong only to people who understand code, models, and design. Jiucaihezi Studio aims to help ordinary people complete real work with advanced AI:

If you can express the goal, you can use good AI.

16. Access Information

- **Official website:** <https://jiucaihezi.studio/>
- **How to use:** visit the Web version or download the desktop App from the product page
- **Desktop platforms:** macOS / Windows
- **Company:** Shanghai Chunqian Culture Media Co., Ltd.

The shortest workflow

Sign in → create a project → enter Creative Mode → describe the goal → choose a model → generate and save → refine on the canvas → assemble with tools.

17. Important Notes

1. This document describes product positioning, primary capabilities, and typical workflows. It is not a complete technical specification for any particular release.
2. Model names, versions, tasks, quotas, prices, and permissions may change. Refer to the official website and the in-product display for current information.
3. Features related to Web, macOS, and Windows may differ.
4. Media generation, file processing, and external-service calls may require confirmation and may consume credits or incur charges.
5. “Second Brain” describes the combination of project knowledge, fact records, search, inspection, and correction. It does not mean that the model can never make mistakes. For long-term projects, users should confirm important facts, keep versions, and maintain backups.

Jiucaihezi Studio One account. Every model. A second brain that never forgets.
